TODAY COVERED TOIPCS

- ✓ ARRAY AND ITS ADVANTAGES.
- ✓ TYPES OF ARRAY.
- ✓ JAGGED ARRAY.

ARRAY

- An array is a collection of elements of the same data type stored in the contiguous memory location.
- The each element is accessed using an index, starting from the (0).

SYNTAX

```
datatype[] arrayName=new  
datatype[size];
```

ADVANTAGES OF ARRAY

- Stores a multiple value of the same data type using a single variable.
- Easy to access elements using their index.
- Reduces code by avoiding many separate variables.
- Easy to process using loops(for,while,enhanced for loop).
- Useful to sorting and searching the algorithms in java.

TYPES OF ARRAY

- **One Dimension array**
- **Two Dimensional Array**

ONE DIMENSION ARRAY

A one dimensional array stores elements in a single row.

EXAMPLE

```
int[] arr = {10,20,30,40,50};
```

TWO DIMENSIONAL ARRAY

- A two dimensional array stores data in rows and columns.
- This known as called matrix form.

EXAMPLE

```
Int[][]arr={  
    {1,2,3},  
    {4,5,6}  
};
```

Jagged Array In Java

A Jagged Array is a two dimensional array where each row can have a different number of columns.

- ✓ In normal 2D array → all rows have the same length
- ✓ In jagged arrays → each row can have a different length
