SUPER KEYWORD IN JAVA

In java, the **super** keyword is a reference variable that is used to refer to the immediate parent class object.

Simply put, **super** helps the child class access methods, variables, and constructors of its parent class.

Why do we use **super?**

Purpose

To access parent class variables.

To call parent class methods.

To call parent class constructor.

Description

When a subclass has a variable with the same name.

When a subclass overrides a method.
To initialize parent class data.

Using super to refer to parent class variables

- when a subclass have a variable *with the same name* as in the parent class.
- The *child variable hides* the parent one.
- We can use **super,variableName** to access the parent class variable.

Using super to Call Parent Class Constructor

- ☐ **super()** is used to call the parent class constructor from the child class constructor.
- ☐ It must be the first statement inside the child constructor.

Using super(parameter) for Parameterized Constructors

You can also use **super(arguments)** to call a parameterized constructor of the parent class.

Summary Table

Use of <code>super</code>	Purpose	Example
<code>super.variable</code>	Access parent variable	<code>System.out.println(super.name);</code>
<code>super.method()</code>	Call parent method	<code>super.display();</code>
<code>super()</code>	Call parent constructor	<code>super();</code> or <code>super(param);</code>
